Meta Careers Redesign

Overview

The website to which I decided to give an overhaul was the website for Meta Careers. It is the job and recruitment website for the tech-giant Meta. It is hosted on an Ubuntu machine in the cloud using Nginx and Gunicorn. You can find it here: http://ncrypt.abr-projects.me (Chrome might block the connection because the site is not secure so you may try other browsers like Brave)

Pages

1. **Home Page:** The first page I redesigned was the home page. It is the most critical page of any website since the user's impression of the entire website is determined here. I decided to keep much of the same theme for the home page. A banner with some text, a section where the employees at top posts are saying good stuff to attract more people, and in the end a section is showcasing the company's other subsidiaries.

2. **Jobs:** This was the page I decided to give a major change to. The actual page is quite monotonous and not exciting to look at. I decided to spice things up by giving it a new layout altogether. I took the gradient element from the home page and applied it to this one also. I changed the layout of the job postings to be more attractive and also so that the essential things were clearly visible. In the end, I added a special "Top Job" posting to the side.

3. **About:** Once again, I decided to do this page on my own and give it a flare. I took inspiration from a previous nCrypt submission I had a year ago and designed the page in a similar way. A picture and some text in alternating order. This breaks the monotony of "About" pages which are in most cases heavily laden with text.
